Technical Bulletin No. 22, "Methods and Materials for Checking Notorola VFC PA-7705 Transmitter and PA-7706 Receiver Tened Circuits" has been checked out by the INB Branch and minor changes are being made before issuance.

The Sloping Vee Antenna Bulletin is almost completed now. Without any further delays it should be issued next month.

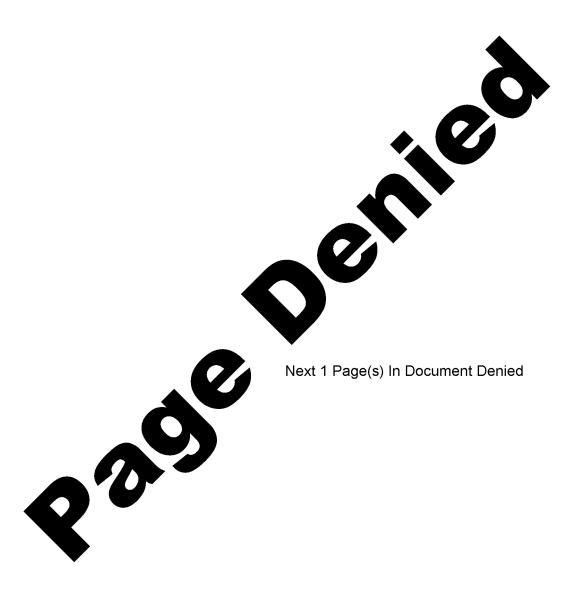

The following Technical Bulletin was issued during this reporting period. Technical Bulletin No. 26, "Voltage and Resistance Measurements for Vacuum Tubes VOOL and VOO2 in Radio Receivers 51J-2, 3, and 4.

Drawings are being prepared covering the antenna requirements for the new Headquarters building. The antenna requirements were established as a result of a memorandum received from OC-O+T which outlined specific communications requirements.

On 19 September project engineers met with representatives from MSA concerning the installation of a KY-ll Ciphony system which is being considered for the new building - a memorandum outlining space, power, air conditioning and other requirements was prepared. A copy of this memorandum was forwarded to the OC representative of the New Building Planning Staff.

recuantear transmitter int

PROJECT REQUIREMENT

To increase the safety features of the 16-F and 231-D type transmitters by providing a mechanically actuated switch that will ground the high voltage when the doors of these transmitters are opened.

ROJECT DESCRIPTION

Determine the type and quantity of switches for each type of transmitter. Have an outside consulting firm investigate the circuitry and construction of the 16-F and 231-D type transmitters for the best possible arrangement of wiring and placement of the switches.

This firm will also purchase the switches and other hardware to make an amount of kits, complete with installations instructions.

Secure authorization to make installation of these switches mandatory.

The same of the first state of the same of

During this reporting period, the Avion Company has completed fabrication of the modification kits. The first 50 units, 25 ea. 16-F and 25 ea. 231-D, were shipped on 12 September after an inspection of the completed packages by the project engineer on the two previous days. This inspection indicated that the micro switches on the rear of some of the units was not properly adjusted. This difficulty was corrected at the Avion plant before shipment, and an inspection of 23 September at the as a double check revealed that the misalignment has been corrected.

Avion will ship the additional 138 units, 99 ea. 231-D and 39 ea. 16-F, in two shipments on 1 October and 8 October.

The paper work has been initiated to send the proper number of each modification kit type to the field base stations as soon as all the kits reach the warehouse, and it is hoped that this project will be completed during the next reporting period.

PPROVAL DATE	APPROVED	TARTI	IG DATE	COMPLETION DATE
July 1958		July	1958	

During this reporting period, the formal report on the life test of the cable was received from R&D Laboratory. The cable was subjected to severe bending stresses at the point just above the feed-through where the original failures on the old cable had occurred. After approximately 2,200 bends, one of the wires in the cable ruptured, although the outside rubber covering was still in tact. The cause of the failure was attributed to a small strand of thread which holds all the wires together just above the feed-through. The cable is considered a satisfactory replacement due to the great number of bends required before rupture. However, to insure even greater reliability, the project engineer plans to conferent NEMS-Clarke, the manufacturer of the cable, before any additional cables are produced to investigate the possibility of removing the binding thread.

NEMS-Clarke is about to begin fabrication of 5 ea. modification kits for the RS-1, including new power cables for the RR-2B and RT-3, new crystal socket for the RT-3, and new waterproofing compound. Modifications of 5 ea. RS-1 units will begin immediately upon the completion of the modification kits, with exact techniques and degree of difficulty being especially noted.

1) A voltage regulated B-plus power supply.

2) When an operator uses a receiver for monitoring his own transmitter signal, both the monitor receiver noise level and the incoming signal are heard simultaneously unless the monitor receiver volume is manually reduced. a relay circuit can be designed so that the monitor receiver audio output is OFF when a signal is being received (key up) and ON when a signal is being transmitted (key down).

Both of these suggestions are being considered for the modernization of the unit.

Brochures were received from several manufactures of counting equipment. None of the counters described are readily adaptable to our requirements.

The Veeder-Root representative is checking to determine whether or not a small counter can be modified to meet our requirements. He is quite sure that he can provide a counter that will prove satisfactory. The Veeder-Root representative was sent a Security Questionnaire 29 August 1958 and will be processed as quickly as possible so that we can have direct contact with him.

At present, the TSEC/KL-7 is being appraised in order to determine the most practical and reliable method of connecting the counter and alarm; mechanical vs. electrical counter, external vs. internal mounting, etc. The final decision, of course, will depend upon the type and size of the counter selected. Since the selection appears to be limited the project will be somewhat statis until a security clearance action is completed on the Veeder-Root representative. At that time more detailed information on our requirements will be presented to him.

25X1

An all electronic system was designed using IN645 diodes which will provide a much smaller package and utilize a simpler power supply than a relay operated circuit.

25X1

The tentative circuit makes use of RC charging and discharging circuits which will transfer a positive pulse to the grid of a trigger tube only if the sequence space, C, I, T, E is typed into the unit. Any other sequence of characters will not transfer the pulse.

The necessary parts for an experimental electronic unit have been requisitioned.

Arrangements are now being completed to visit the Maxson Instrument Co., Long Island City, N. Y. in order to ascertain their capability to produce speech clippers.

A Langevin speech clipper has been located at the Kahn Research Lab. This clipper is the property of the VOA, and the possibility of borrowing this clipper for tests purposes will be investigated if the Maxson Instrument Co. is unable to supply one unit for immediate testing.
